

RQ3 ablations against EMBR tuned, paired

Positive means removing the signal cost accuracy. 4 of 4 intervals include zero (ringed on the zero line), so no ablation is conclusive.

Whiskers are 95% bootstrap intervals on the per query paired difference, the quantity the sign flip test asks about. A zero width interval means that ablation never reordered a held out top 5, so it is uninformative on this label set rather than switched off. Read each Holm p against its own attainable floor: a floor at or above 0.05 could not have reached significance under any arrangement of its own data.

run 20260817-160950 | commit 55e6533452c0 (dirty tree) | model stub | labels dawn-whitmore v1 | built by assets/build_figures.py

PRELIMINARY: stub model (echoes the player's line), deterministic lexical embedder, v1 single author labels, 10 queries. Every interval spans zero and no Holm corrected comparison is significant: read direction, not ranking.
